Distribution of mistletoe (*Viscum album* L.) as an indicator of Global Warming

Over the past five years, the territory from Sovetsk to Olsztyn is affected by the wood semi-parasitic bushes of the mistletoe (*Viscum album* (L.)) more than 60% of the entire wood massif, regardless of the tree species.

The only common feature among infected trees is their age. Our project deals with the study of this phenomenon in the context of global warming.

Desiccated by the mistletoe, the trees will perish, but overgrown with mistletoe, living trees become cluttered. In cases when in the sanitary pruning of trees, mistletoe falls into wood waste, this shrub is transported to the landfills and disposed of on general grounds. The ways of solving this problem can be different, but the most rational, from our point of view, is the formation of interest in the mistletoe, as a green decorative and Christmas decoration, partially emotionally replacing or supplementing the New Year tree, and also as a medicinal raw material.

The project should draw the attention of residents, professionals and businessmen to the white mistletoe, as to the decorative and medicinal plant used in flower compositions, in plant extracts and tinctures, which can allow a complete cycle of care of green plantations, starting from clearing of semiparasitic thickets, and finishing with manufacturing of high-grade floristic and pharmaceutical products. Since the mistletoe's berries contain a number of plant poisons, the project should be conducted with the involvement of specialists from scientific and research institutions.

Extension of urban broadband network

Planned actions:

1. possibility of connecting educational institutions, public and other units of local government to high-speed Internet,
2. increasing the usage of broadband networks in security field by extending the urban monitoring system,
3. increasing the usage of broadband networks in security field by monitoring environmental conditions and prevent crisis situations, floods, water contamination etc.
4. traffic statistics research „Kaliningrad Oblast - Sopot / Tri-City”,
5. due to the changes in law, the centralization of IT systems subordinated to Local Self-Government units to provide with common services, such as the joint settlement of VAT,
6. improving radio communications for emergency services by raising the transmitters for areas without coverage (network density of digital radio transmitters).
